DETAILED ACTION

1> Claims 1-20 are presented for examination.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

- Claims 1, 6, 7, 11, 12, 16 and 17 are rejected under 35 U.S.C 102(e) as being anticipated by Berstis, U.S Patent No. 6.182.122 ["Berstis"].
- 4> Berstis discloses a system for facilitating communication between a user and a network of information items [abstract], comprising:

a remote data storage device for storing the information items, wherein the

Application/Control Number: 09/886,071

Art Unit: 2152

information items are stored in the form of pages, and wherein the pages contain a plurality of links to other information items [column 2 <line 66> to column 3 <line 4> | column 8 <line 66> to column 9 <line 7> | column 9 <lines 35-50>];

a client device having a user interface program thereon, for allowing a user to interface with the network and request the information items [column 1 <lines 47-54>];

a server device, in communication with the client device and in communication with the remote storage device, for handling information requests from multiple clients and for storing information retrieved from the data storage devices locally in a server cache memory [column 6 <line 60> to column 7 <line 27> | column 8 <line 66> to column 9 <line 7> | claim 1];

a data collection module for collecting and storing successive user actions [column 10 lines 48-51> | claims 1 and 11 where: monitoring the users who access a specific page is equivalent in functionality to collecting and storing of user actions; consequently, the intermediate server is equivalent to the claimed data collection module]; and

a probability module in communication with the data collection module for calculating a probability for the links, and for comparing the probability to a predetermined threshold value to identify predicted links, and for retrieving the predicted information items associated with the links from the remote data storage devices and storing the predicted information items in the server cache memory in advance of a user request for the selected information items [column 10 clines 5-9 and lines 36-51 | claims 1, 24 and 26> where: selecting which links to prefetch based on a

Application/Control Number: 09/886,071

Art Unit: 2152

historical probability is comparable to retrieving predicted information items based on a predetermined threshold value].

- As to claim 2, Berstis discloses the system of claim 1, wherein the probability module updates the probabilities assigned to the links with each successive user activity [column 10 lines 48-51> | claim 1 where: the historical probability is dependant upon monitoring the number of users which access a particular page (user activity)].
- As per claims 6, 7, 11, 12, 16 and 17, they do not teach or further define over the limitations recited in claims 1 and 2. Therefore claims 6, 7, 11, 12, 16 and 17 are also rejected for the same reasons as set forth in claims 1 and 2, supra.

Claim Rejections - 35 USC § 103

- 7> The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 8> Claims 3-5, 8-10, 13-15 and 18-20 are rejected under 35 U.S.C 103(a) as being unpatentable over Berstis, as applied to claim 1 above, in view of Barrett et al, U.S Patent No. 5.727.129 ["Barrett"].

Art Unit: 2152

- 9> Barrett was cited by Applicant in IDS #4, dated 1.8.2002.
- 10> As to claim 3, Berstis does not disclose a system wherein the probability module aborts retrieving the predicted information items if the user requests an information item other than the predicted information items.
- Barrett teaches a network data communication system wherein a probability module aborts the retrieval of predicted information items if the user requests an information item other than the predicted information items [abstract | Figure 7 <items 58, 64> | column 9 lines 1-16>]. It would have been obvious to one of ordinary skill in the art at the time the invention was made to implement the functionality of module-initiated abortion of the retrieval of predicted information items in Berstis' probability module. One would have been motivated to do this implementation to prevent unnecessary downloading of unwanted content in Berstis' system.
- As to claim 4, Berstis does not disclose a system wherein the probability module continues retrieving the predicted information items from the remote data storage devices and storing the predicted information items in the server cache memory if the user requests the predicted information item.
- Barrett teaches a system wherein the probability module continues retrieving the predicted information items from the remote data storage devices and storing the predicted information items in the server cache memory if the user requests the

obvious to one of ordinary skill in the art to include the functionality of Barrett's probability module into Berstis' module to increase the amount of control the module has over the prefetching of predicted data. One would have been motivated to combine these teachings to allow the module to anticipate user actions, and if correctly predicted, to continue with the downloading of the anticipated content.

- As to claim 5, Berstis discloses the system of claim 4, wherein the probability module downloads the user requested information item to the client from the server cache memory [column 8 <lines 40-46>].
- As to claims 8-10, 13-15 and 18-20, they do not teach or further define over the limitations recited in claims 3-5. Therefore, claims 8-10, 13-15 and 18-20 are also rejected for the same reasons as set forth in claims 3-5, <u>supra</u>.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
